My largest contribution came in the form of creating the HTML, CSS, and Bootstrap for the website. I've had some web experience prior to this project, but not a lot of that has involved Bootstrap. Therefore, that was something valuable that I learned during this project. We originally had in mind that we would use Foundation instead of Bootstrap, but given the extensive documentation on Bootstrap, it seemed to be a better choice for us.

I also had multiple minor contributions apart from creating almost all of the HTML and CSS. I helped in creating an endpoint in Node so that a buyer can send an email to a seller. This same endpoint can be used in the "Contact Us" portion of the website. Also, I had contributions with regard to the database and creating it's schema. I have a good working knowledge of Mongo DB and was able to help other members in our group understand how a document database works.

Although we did not complete as much of the website as we intended (we were probably a little ambitious at the onset), I feel that we were able to create a good first iteration of our website. The future of this website will probably lie with Jeff Stoddard, as he was the person in our group responsible for this project's idea.
